

## 2.5 - Programme

The experience of Rulmeca for over 55 years producing belt conveyor rollers, has perfected and expanded the range of products we offer, so that the user will find the correct answer to the most diverse and difficult applications,

This catalogue presents the different series of rollers in production and their relative utilisation criteria.

1

2

- 1 - Rollers in steel series PSV
- 2 - Rollers in plastic series PL
- 3 - Rollers in steel series MPS
- 4 - Rollers in thermoplastic polymer series TOP
- 5 - Rollers in steel series RTL

5

## 2 Rollers

### **2.5.1 - Rollers series PSV**

#### **Where used**

Rollers PSV are particularly suited to conveyors that operate in very difficult conditions, where working loads are high, and large lump size material is conveyed; and yet, despite these characteristics, they require minimal maintenance.

Typical types of application are: mines, caves, cement works, coal-fired electric utilities and dock installations.

The effectiveness of the PSV roller sealing system provides the solution to the environmental challenges of dust, dirt, water, low and high temperatures or applications where there is a large temperature imbalance between day and night.

The working temperature, with standard greased components is defined as between -20°C and +100°C.

It is possible to reach temperatures outside of this range using special grease, bearings and seals.

Spindle

### Characteristics

The rollers series PSV offer the highest quality and the maximum load capacity of Rulmeca's production.

The unique design of our hermetic seal system not only protects the bearings but offers maximum effectiveness and long life, even in the presence of the most severe pollutants.

The control of all roller materials from incoming inspection, through manufacture and assembly in the automatic cycle, with on line function tests on 100% of production, allows us to state that the function and life of this roller is among the highest in the world.

Attention to detail, whether at the design stage or in the various manufacturing phases, observing close limits of starting resistance, of eccentricity and axial play, results in notable savings in energy and a reduction in maintenance over time.

These factors give rise to business economies, confidence and high productivity, objectives pursued by all users of belt conveyors.

The Quality System certified ISO 9001:2008 got from Rulmeca attest to their continuous quality standards, and their stated performance.

### Roller shell

It is the external diameter of the roller that is in contact with the conveyor belt.

It consists of a steel welded tube produced according to Rulmeca standards, with reference to tight tolerances and particular specifications.

The tube is cut and machined using automatic numerically controlled machines, that guarantee and maintain the tolerances and the precision of the square cut.

### Bearing housing

It is a steel monolithic structure, deep drawn and sized to a forced tolerance ISO M7 at the bearing position. This tolerance is necessary to guarantee the optimum assembly of the bearing by ensuring that it is square to the spindle of the roller.

The thickness of the housings is proportional to the spindle diameter and to the bearing type, with thicknesses that are up to 5 mm, to guarantee the maximum strength for each application, including the heaviest.

### Monobloc

The bearing housings of the PSV rollers are welded to the tube body using autocentralising automatic welding machines utilising a continuous wire feed: our patented system "UNIBLOC".

Section of PSV/1,2,3,4,5-FHD

Tube and bearing housing form a monolithic structure of exceptional strength which itself reduces to the minimum any imbalance in the roller. This guarantees the alignment and concentricity with respect to the external diameter of the component parts of the sealing system.

The optimum balance and concentricity thus obtained allows these rollers to be used at the highest speeds, eliminating harmful vibration to the conveyor structure and the "hammer effect" on the bearings of the rollers.

### **Spindle**

This is the component which sustains the roller when it is assembled into the troughing set supports. It is made from drawn steel, cut and machined by automatic numerically controlled machines.

The spindle is ground for all its length or in the bearings and seals zones to a precision tolerance, to guarantee a perfect match of bearings, seals and optimum performance.

### **Bearings**

These are the parts which give virtually frictionless rotation to the tube body with respect to the fixed spindle.

Precision bearings only are used.

They are the radial ball race type of the series: 6204, 6205, 6305, 6206, 6306, 6308 with internal clearance tolerance C3,

ideal for applications of rollers used for belt conveyors.

### **Connecting spindle / bearing, bearing housing**

PSV rollers require particular tolerances for the bearing housing, for the spindle and the bearing itself, that enables the roller to function optimally for a long life, whilst under pressure.

The above mentioned tolerances functionally guarantees the autoalignment of the internal and outer bearing rings of the ball race resulting in a good performance even when the spindle deflection is extreme due to overloading.

### **Sealing**

The seals comprise the most important components in the design of the PSV rollers.

The principal task of the seals is to protect the bearing from harmful elements that may impinge from the outside or the inside of the roller.

The working conditions of these rollers is very often the most severe, with the presence of dust, abrasive sand, water and various other pollutants.

On the inside of the roller there may be particles formed by the rusting of the internal

tube body or condensation caused by the thermal changes that arise between day and night in particular climates.

The seal must also contain and retain a good quantity of grease for the bearing lubrication.

As a guarantee and to complete the PSV roller sealing system the final components are assembled at either end:

- strong external stone guards formed as a shield, in anti-corrosive thermoplastic material, to protect the seals from the fall of material onto the end cap of the roller.

- seal with two principal sections: one external and one internal.

- external section: self cleaning in that it centrifugally repels water and dust naturally towards the outside. Comprises a lip ring seal made from soft anti-abrasive rubber with a large contact surface that provides an effective hermetic seal of long working life. The self cleaning effect is principally due to the particular design of the cover cap and the shape of the bearing housing which when rotating, tends to expel all pollutants, centrifugally.

- internal section: triple lip labyrinth in nylon PA6 greased to give further bearing protection.

## 2 Rollers

### serie PSV

Behind the bearing a sealing ring in nylon PA6 is positioned that provides an ample grease reservoir and also retains the grease near to the bearing even when there is a depression due to an abrupt change in temperature (pumping effect).

This ring acts also as a seal to counteract the eventual formation of condensation and oxidation which could take place inside the tube.

- locking system: provided by means of the correctly located circlips, which today is the best and the strongest system implemented in heavy rollers for belt conveyors.

#### Lubrication

PSV rollers are lubricated for life with an abundant quantity of lithium based water repellent grease, that guarantees the correct lubrication for the working life of the roller.

#### Final inspection

All PSV rollers are assembled on automatic assembly machines with live test stations that maintains roller rotation for a sufficient time to distribute the grease into the bearings and all the other internal components. 100% of the rollers are tested to verify their low-torque characteristics.

### Programme of production series PSV

The table indicates the type and diameter of standard rollers in production according to European standards to DIN 15207- ISO 1537.

Upon request rollers may be supplied with varying dimensions, tube thickness and diameters according to standards CEMA, BS, JIS, AFNOR and FEM.

Rollers certified according to ATEX 94/9/EC norms,  
Explosion Group I category M2 for Mines,  
Explosion Group II category 2G for gas and 2D for dust,  
Explosion Group II category 3G for gas and 3D for dust  
(Zones 1, 2 for gas, Zones 21, 22 for dust).

## 2 Rollers

The table indicates rollers with non standard diameters that we are already producing.

Upon request rollers may be supplied with varying dimensions, tube thickness end diameters according to standards CEMA, BS, JIS, AFNOR and ISO-FEM .
